Assemblad: the Source for new technologies

When **Assemblad** decided to enter the world market of garage equipment it was also because of the technologies developed in house. In an industry where majority of offers are made of products developed perhaps a couple of decades ago, there is abundant room for newly developed test equipment to launch.

A good example of applied new technologies is on brake tester. Most brake testers currently in the market are based on outdated technologies coming from the days when brake testing was first massively introduced in the markets over two decades ago. **Assemblad** decided to approach the market in a completely different way: find newest technologies available and design new products around that: the **modular split-bench roller brake testers** and the **modern digital plate brake testers**.

In the field of emission test, **Assemblad** has long since been using its own proprietary technology: it's the **INFRA QUEEN oiml class 00 4/5-gas bench** and the **OPA KING ISO 11614 and SAE J1677 partial flow smoke bench** that equip all **Assemblad** emission testers for Workshops and Inspection Centres. In an industry where changes on emission tests are closely on the way, a true emission tester manufacturer gives the guarantee that the products will keep up for the new coming inspection procedures.

The **INFRA QUEEN** gas bench and the **OPA KING** smoke bench are also supplied to oem customers around the world which build their own exhaust gas analyzers and Diesel smoke meters for their markets.
